

Four observed phase states around configured B3 stress events

Every microchart contains four actual phase means: (1) tranquil reference, (2) local pre-event, (3) event-containing, and (4) post-event reorganization.

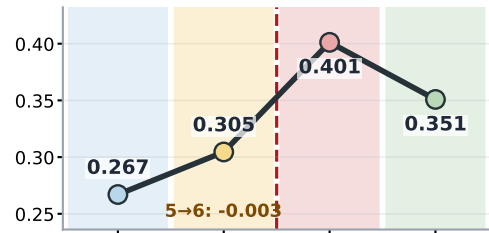

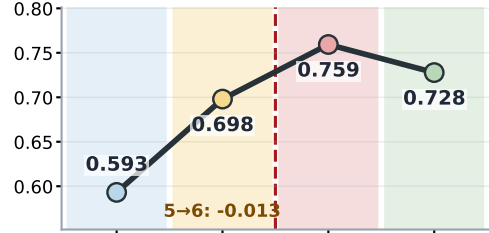

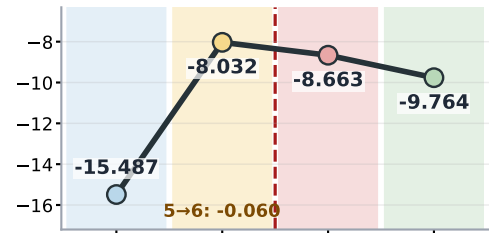

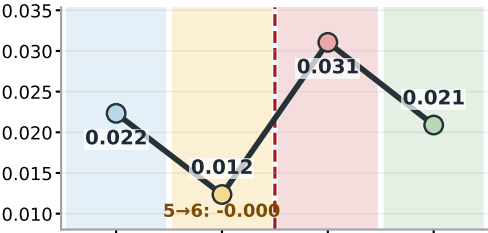

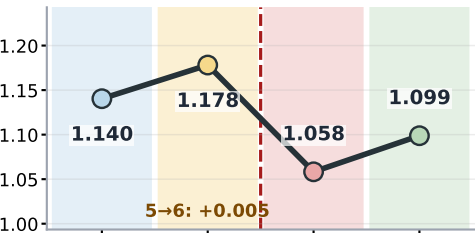

Dashed red divider = externally observed shock between pre-event and crisis. Amber label under pre-event = final within-pre step (window 5→6), not a phase mean.

Scales are metric- and event-specific to preserve observed magnitudes; compare trajectories within a microchart, not vertical positions across different metrics.

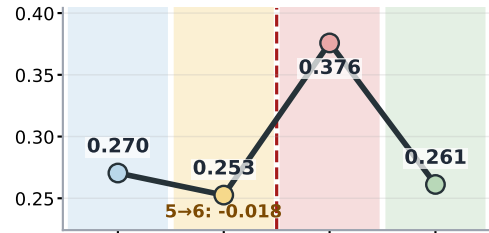

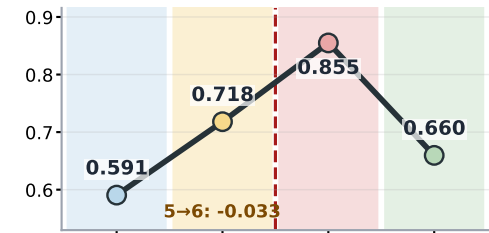

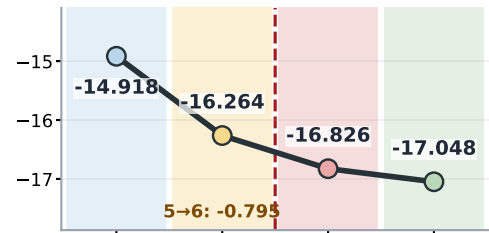

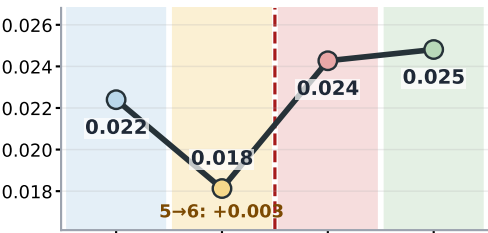

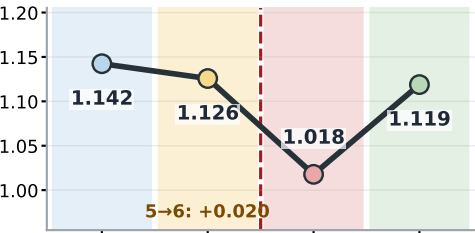

Asian crisis
1997-10-27
shock -11.56%

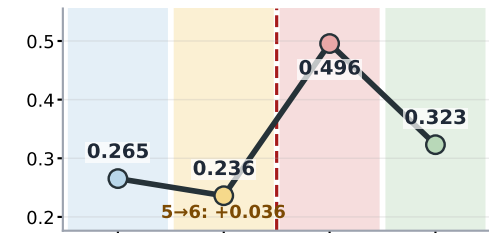

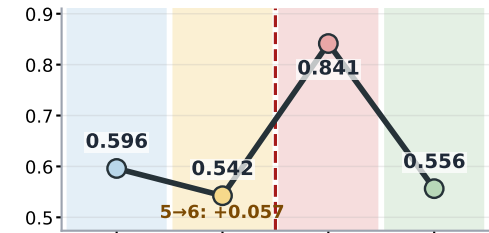

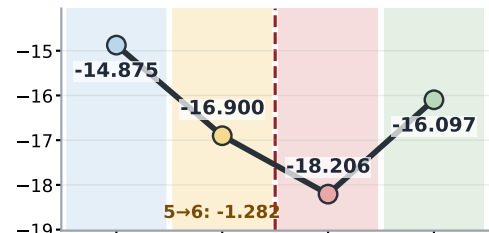

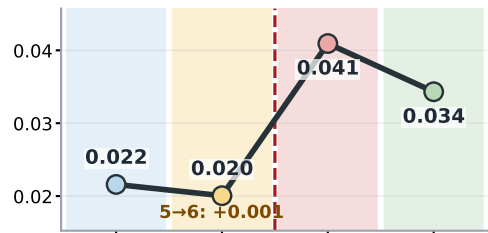

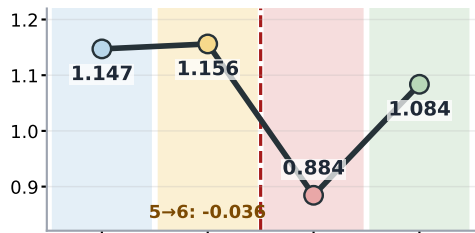

Russian default / LTCM
1998-08-27
shock -8.44%

Global financial crisis
2008-09-29
shock -8.74%

COVID-19
2020-03-09
shock -12.54%

Five recurrent focal indicators: mean PMFG distance, distance variance, mean Forman--Ricci curvature, KS Gaussian-null statistic, and MP signal-variance fraction. The phase-concordance table retains the complete 13-metric evidence, including event-specific centrality results. This retrospective display is descriptive, not causal or predictive.
